

Compact Security

CBR4SC

OVERVIEW

This rack has become Australia's top choice, with thousands of installations across the country. Its wheel supports are designed with staggered heights, enabling bicycles to be positioned with 300mm spacing, which is half the usual requirement of 600mm with other racks.

The leaning rail feature of this bicycle rack has made it immensely popular among cyclists. It offers complete support to the bicycle, significantly reducing the risk of accidental damage. Additionally, it allows cyclists to securely position either the front or back wheel while using a "U" lock to fasten the frame and the other wheel to the leaning rail.

When it comes to accommodating and securing a large number of bicycles, the CBR4SC is the logical option. It allows double the number of bicycles to be securely parked in a given area, making it highly efficient.

The Compact Security Bicycle Rack is supplied in flat pack form for convenient do it yourself installation. The security rails with wheel supports are provided separately and can be easily bolted to the base rail, allowing for the creation of single, double-sided, or angled units.

Also available in galvanised finish.
